COMPLEX ANALYSIS , PROBABILITY AND
STATISTICAL METHOD

MODULE : 01

CALCULUS OF COMPLEX VARIABLES

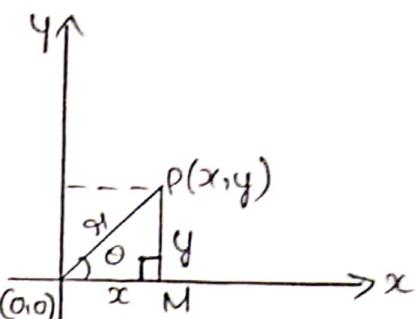

Definition:

let x, y be the two real values, then the number
(or) variable $z = x + iy$ is called the complex variable (or)
complex number. where the first part of z is called
real part and the second part is called imaginary part.
But both x and y are the real values.

$z = x + iy$ is a complex number in the Cartesian form
and its conjugate complex is $\bar{z} = x - iy$ and $|z| = \sqrt{x^2 + y^2}$

Geometrical representation:

let \overrightarrow{ox} , \overrightarrow{oy} be the real and imaginary axis, let 'p' be any point on the plane and 'M' be the foot of the perpendicular of 'p' on the real axis. $O(0,0)$

let ' θ ' be the angle b/w \overrightarrow{OP} and \overrightarrow{ox} . Then from the right angle \triangle OPM .

$$\sin \theta = \frac{y}{r} \Rightarrow y = r \sin \theta$$

$$\cos \theta = \frac{x}{r} \Rightarrow x = r \cos \theta$$

Substitute the above in a complex variable $z = x + iy$
we get, $z = r \cos \theta + i r \sin \theta$

$$z = r (\cos \theta + i \sin \theta)$$

$\boxed{z = r e^{i\theta}}$ is called the complex variable in polar form.

Complex valued function:

- Suppose $u(x,y)$ and $v(x,y)$ be the two real functions in the variables 'x' and 'y', then the complex valued function in the Cartesian form can be defined as

$$w = f(z) = u(x,y) + iv(x,y) = u + iv$$

- Suppose $u(r,\theta)$ and $v(r,\theta)$ be the two real functions in the variables of 'r' and ' θ ', then the complex valued function in the polar form can be defined as

$$w = f(z) = u(r,\theta) + iv(r,\theta)$$

Some Important Results:

WKT,

$$e^{ix} = \cos x + i \sin x \rightarrow (1)$$

$$\text{and } e^{-ix} = \cos x - i \sin x \rightarrow (2)$$

$$\text{from (1) + (2), } e^{ix} + e^{-ix} = 2 \cos x$$

$$\Rightarrow \cos x = \frac{e^{ix} + e^{-ix}}{2} \rightarrow (3)$$

$$\Rightarrow (1) - (2), \quad e^{ix} - e^{-ix} = 2i \sin x$$

$$\Rightarrow \sin x = \frac{e^{ix} - e^{-ix}}{2i} \rightarrow (4)$$

$$\therefore (3) \Rightarrow \cos ix = \frac{e^{i2x} + e^{-i2x}}{2}$$
$$= \frac{e^{-x} + e^x}{2}$$

$$\Rightarrow \boxed{\cos ix = \cosh x}$$

$$(4) \Rightarrow \sin ix = \frac{e^{i2x} - e^{-i2x}}{2i}$$
$$= \frac{e^{-x} - e^x}{2i}$$
$$= \frac{-(e^x - e^{-x})}{2i}$$
$$= \frac{i(e^x - e^{-x})}{2}$$
$$= \frac{i(e^x - e^{-x})}{2}$$

$$\Rightarrow \boxed{\sin ix = i \sinh x}$$

Some definitions:

* Limit of a Complex variable: Suppose ' z ' be an complex variable to the neighbourhood of ' z_0 ', then for any positive small quantity ' δ ' (delta), $|z - z_0| \leq \delta$ is called the limit of a Complex variable.

* Limit of a Complex valued function: Suppose $w = f(z)$ be a complex valued function for any positive quantity ' ϵ ', we have $|f(z) - f(z_0)| < \epsilon$ (or) $|f(z) - l| < \epsilon$ (or)
 $\lim_{z \rightarrow z_0} f(z) = l$ is called limit of a complex valued function.

* Differentiability of a function: Suppose $w = f(z)$ be a complex valued function and is differentiable at z , then
 $f'(z) = \frac{dw}{dz} = \lim_{\delta z \rightarrow 0} \frac{f(z + \delta z) - f(z)}{\delta z}, \delta z \neq 0,$

* Continuity: A Complex valued function $f(z)$ is said to be a continuous, if and only if $\lim_{z \rightarrow z_0} f(z) = f(z_0)$

* Analytic of a function:

let $w = f(z)$ be a Complex valued function and it is said to be an analytic function when $w = f(z)$ is to be differentiable at any point of z ,

$$\text{i.e., } f'(z) = \frac{dw}{dz} = \lim_{\delta z \rightarrow 0} \left(\frac{f(z + \delta z) - f(z)}{\delta z} \right) \therefore \delta z \neq 0$$

It is also called regular (or) holomorphic function.

Theorem: Cauchy Riemann Equation in Cartesian form (or)

C-R Equation.

Statement: The necessary Condition that the function

$$w=f(z)=u(x,y)+iv(x,y)=u+iv$$

analytic at any point $z=x+iy$ is that, their exists 4 continuous first order partial derivatives,

i.e., $\frac{\partial u}{\partial x}, \frac{\partial u}{\partial y}, \frac{\partial v}{\partial x}, \frac{\partial v}{\partial y}$ can satisfy the given equation

$$\frac{\partial u}{\partial x} = \frac{\partial v}{\partial y} \text{ and } \frac{\partial v}{\partial x} = -\frac{\partial u}{\partial y}$$

Proof: Given, $w=f(z)=u(x,y)+iv(x,y) \rightarrow (1)$ is a complex valued function in the Cartesian form, for the complex variable $z=x+iy$.

$$\therefore \text{eqn (1)} \Rightarrow f(x+iy) = u(x,y)+iv(x,y) \rightarrow (2)$$

and given $w=f(z)$ is an analytic function.

differentiating eqn (2) wrt 'x' partially,

$$(2) \Rightarrow f'(x+iy) \cdot 1 = \frac{\partial u}{\partial x} + i \frac{\partial v}{\partial x}$$

$$\Rightarrow f'(x+iy) = \frac{\partial u}{\partial x} + i \frac{\partial v}{\partial x} \rightarrow (3)$$

diff. eqn (2) wrt 'y' partially,

$$(2) \Rightarrow f'(x+iy) (i) = \frac{\partial u}{\partial y} + i \frac{\partial v}{\partial y}$$

$$\Rightarrow f'(x+iy) = \frac{1}{i} \frac{\partial u}{\partial y} + \frac{\partial v}{\partial y}$$

$$\Rightarrow f'(x+iy) = \frac{i}{i^2} \frac{\partial u}{\partial y} + \frac{\partial v}{\partial y}$$

$$\Rightarrow f'(x+iy) = -i \frac{\partial u}{\partial y} + \frac{\partial v}{\partial y}$$

$$\Rightarrow f'(z+iy) = \frac{\partial V}{\partial y} - i \frac{\partial U}{\partial y} \rightarrow (4)$$

\therefore from (3) & (4)

$$\Rightarrow \frac{\partial U}{\partial x} + i \frac{\partial V}{\partial x} = \frac{\partial V}{\partial y} - i \frac{\partial U}{\partial y}$$

$$\therefore \boxed{\frac{\partial U}{\partial x} = \frac{\partial V}{\partial y} \text{ and } \frac{\partial V}{\partial x} = -\frac{\partial U}{\partial y}}$$

Hence proved.

Cauchy Riemann Equation in polar form.

Statement: If $w=f(z)=u(r_1, \theta) + iv(r_1, \theta)$ is an analytic function at $z=r_1 e^{i\theta}$, then there exists continuous first order partial derivatives $\frac{\partial u}{\partial r_1}, \frac{\partial u}{\partial \theta}, \frac{\partial v}{\partial r_1}, \frac{\partial v}{\partial \theta}$ can satisfy the equations

$$\frac{\partial u}{\partial r_1} = \frac{1}{r_1} \cdot \frac{\partial v}{\partial \theta} \text{ and } \frac{\partial v}{\partial r_1} = -\frac{1}{r_1} \frac{\partial u}{\partial \theta}$$

Proof: Given $w=f(z)=u(r_1, \theta) + iv(r_1, \theta) \rightarrow (1)$ is an analytic function at $z=r_1 e^{i\theta}$.

$$\therefore \text{eqn (1)} \Rightarrow w=f(r_1 e^{i\theta})=u(r_1, \theta) + iv(r_1, \theta) \rightarrow (2)$$

Differentiating eqn (2) w.r.t ' r_1 ' partially,

$$(2) \Rightarrow f'(r_1 e^{i\theta}) e^{i\theta} = \frac{\partial u}{\partial r_1} + i \frac{\partial v}{\partial r_1}$$

$$\Rightarrow e^{i\theta} \cdot f'(r_1 e^{i\theta}) = \frac{\partial u}{\partial r_1} + i \frac{\partial v}{\partial r_1} \rightarrow (3)$$

Diff. eqn (2) w.r.t ' θ ' partially,

$$(2) \Rightarrow f'(r_1 e^{i\theta}) r_1 \cdot e^{i\theta} = \frac{\partial u}{\partial \theta} + i \frac{\partial v}{\partial \theta}$$

$$\Rightarrow e^{i\theta} \cdot f'(r_1 e^{i\theta}) = \frac{1}{r_1} \frac{\partial u}{\partial \theta} + \frac{i}{r_1} \frac{\partial v}{\partial \theta}$$

$$\Rightarrow e^{i\theta} \cdot f'(r_1 e^{i\theta}) = \frac{i}{r_1^2} \frac{\partial u}{\partial \theta} + \frac{1}{r_1} \frac{\partial v}{\partial \theta}$$

$$\Rightarrow e^{i\theta} \cdot f'(re^{i\theta}) = \frac{1}{r} \frac{\partial v}{\partial \theta} - i \frac{1}{r} \frac{\partial u}{\partial \theta} \rightarrow (4)$$

from eqn (3) and (4)

$$\frac{\partial u}{\partial r} + i \frac{\partial v}{\partial r} = \frac{1}{r} \frac{\partial v}{\partial \theta} - i \frac{1}{r} \frac{\partial u}{\partial \theta}$$

$$\therefore \frac{\partial u}{\partial r} = \frac{1}{r} \frac{\partial v}{\partial \theta}, \quad \frac{\partial v}{\partial r} = -\frac{1}{r} \frac{\partial u}{\partial \theta}$$

Hence proved.

Derivation of analytic function:

Step 1: write the given Complex valued function $w=f(z)$

Step 2: write the $z=x+iy$ in the cartesian form and
 $z=re^{i\theta}$ in the polar form, we get

$f(z) = u(x, y) + iv(x, y)$ in cartesian form and

$f(z) = u(r, \theta) + iv(r, \theta)$ in polar form.

Step 3: Identify u and v and verify the C-R equations in
the respective forms.

Step 4: find the derivative of $f(z)$ as

$f'(z) = u_x + iv_x$ in the cartesian form and

$f'(z) = (u_r + iv_r) \cdot e^{-i\theta}$ in polar form.

Step 5: Substitute $x=z, y=0$ in cartesian form and
 $r=z, \theta=0$ in polar form in the
required $f'(z)$.

Problems:

- Verify the function $f(z) = z^2$ is analytic or not, hence find its derivative.

Sol Given, $f(z) = z^2 \rightarrow (1)$

let $z = x+iy$

$$\therefore (1) \Rightarrow f(z) = (x+iy)^2$$

$$f(z) = x^2 + i^2 y^2 + 2ixy \quad \therefore i^2 = -1$$

$$= x^2 - y^2 + 2ixy$$

$$f(z) = (x^2 - y^2) + i(2xy)$$

$$\Rightarrow f(z) = u(x, y) + iv(x, y)$$

$$u = x^2 - y^2, v = 2xy$$

$$\therefore \frac{\partial u}{\partial x} = 2x, \frac{\partial u}{\partial y} = -2y$$

$$\frac{\partial v}{\partial x} = 2y, \frac{\partial v}{\partial y} = 2x$$

$$\therefore \frac{\partial u}{\partial x} = \frac{\partial v}{\partial y} \text{ and } \frac{\partial u}{\partial y} = -\frac{\partial v}{\partial x}$$

\therefore The given $f(z)$ is satisfied C-R equation.

$\therefore f(z)$ is an analytic.

$$\text{WKT, } f'(z) = u_x + iv_x$$

$$\Rightarrow f'(z) = 2x + i2y$$

$$f'(z) = 2(x+iy) \rightarrow (2)$$

$$\text{let } x = z, y = 0$$

$$\therefore f'(z) = 2(z+0)$$

$$\therefore f'(z) = 2z$$

2. Verify $f(z) = z^3$ is analytic or not, hence find its derivative.

Soln Given, $f(z) = z^3 \rightarrow (1)$

$$\text{let } z = r e^{i\theta}$$

$$\therefore (1) \Rightarrow f(z) = (r e^{i\theta})^3$$

$$f(z) = r^3 \cdot e^{i3\theta}$$

$$\Rightarrow f(z) = r^3 (\cos 3\theta + i \sin 3\theta)$$

$$f(z) = r^3 \cos 3\theta + i r^3 \sin 3\theta$$

$$\therefore f(z) = u(r, \theta) + iv(r, \theta)$$

$$U = \pi^3 \cos 3\theta, V = \pi^3 \sin 3\theta$$

$$\therefore \frac{\partial U}{\partial \bar{z}} = 3\pi^2 \cos 3\theta, \quad \frac{\partial U}{\partial \theta} = -3\pi^3 \sin 3\theta$$

$$\frac{\partial V}{\partial z} = 3\pi^2 \sin 3\theta, \quad \frac{\partial V}{\partial \theta} = 3\pi^3 \cos 3\theta$$

$$\therefore \frac{\partial U}{\partial z} = \frac{1}{\pi} \frac{\partial V}{\partial \theta}, \quad \frac{\partial V}{\partial z} = -\frac{1}{\pi} \frac{\partial U}{\partial \theta}$$

$\therefore f(z)$ is an analytic function.

$$\therefore \text{WKT, } f'(z) = e^{-i\theta} [U_{\bar{z}} + iV_{\bar{z}}]$$

$$= e^{-i\theta} (3\pi^2 \cos 3\theta + i 3\pi^2 \sin 3\theta)$$

$$\text{let } z = r, \theta = 0$$

$$\therefore f'(z) = 3z^2$$

=

3. Verify $f(z) = z^n$ is an analytic function or not, hence find its derivative for any positive integer 'n'.

Given,

$$f(z) = z^n$$

$$\text{let } z = re^{i\theta}$$

$$f(z) = (re^{i\theta})^n = r^n \cdot e^{in\theta}$$

$$\Rightarrow f(z) = r^n (\cos n\theta + i \sin n\theta)$$

$$f(z) = r^n \cos n\theta + i r^n \sin n\theta$$

$$\therefore f(z) = u(r, \theta) + iv(r, \theta)$$

$$u = r^n \cos n\theta, v = r^n \sin n\theta$$

$$\therefore \frac{\partial u}{\partial \bar{z}} = n \cdot r^{n-1} \cos n\theta, \quad \frac{\partial u}{\partial \theta} = -n \cdot r^n \sin n\theta$$

$$\frac{\partial v}{\partial z} = n \cdot r^{n-1} \sin n\theta, \quad \frac{\partial v}{\partial \theta} = n \cdot r^n \cos n\theta$$

$$\therefore \frac{\partial u}{\partial z} = \frac{1}{r} \frac{\partial v}{\partial \theta}, \quad \frac{\partial v}{\partial z} = -\frac{1}{r} \cdot \frac{\partial u}{\partial \theta}$$

$\therefore f(z)$ is an analytic function.

$$\therefore \text{WKT, } f(z) = e^{-i\theta} (u_n + i v_n)$$

$$f(z) = e^{-i\theta} (n \cdot n^{n-1} \cos \theta + i n^{n-1} \sin \theta)$$

$$\text{let } n = z, \theta = 0$$

$$f(z) = n \cdot z^{n-1}$$

4. Verify $f(z) = \sin z$ is analytic or not, hence find its derivative.

Soln Given, $f(z) = \sin z \rightarrow (1)$

$$\text{let } z = x + iy$$

$$(1) \Rightarrow f(z) = \sin(x+iy) = \sin x \cdot \cos(iy) + \cos x \cdot \sin(iy)$$

$$\Rightarrow f(z) = \sin x \cdot \cosh y + i \cos x \sinh y$$

$$\Rightarrow f(z) = u(x, y) + i v(x, y)$$

$$u = \sin x \cdot \cosh y, \quad v = \cos x \cdot \sinh y$$

$$\frac{\partial u}{\partial x} = \cos x \cdot \cosh y, \quad \frac{\partial u}{\partial y} = \sin x \cdot \sinh y$$

$$\frac{\partial v}{\partial x} = -\sin x \cdot \sinh y, \quad \frac{\partial v}{\partial y} = \cos x \cdot \cosh y$$

$$\therefore \frac{\partial u}{\partial x} = \frac{\partial v}{\partial y} \quad \text{and} \quad \frac{\partial v}{\partial x} = -\frac{\partial u}{\partial y}$$

$\therefore f(z)$ is analytic

$$\therefore \text{WKT, } f'(z) = u_x + i v_x$$

$$\Rightarrow f'(z) = \cos x \cdot \cosh y - i \sin x \cdot \sinh y$$

$$\Rightarrow f'(z) = \cos x \cdot \cos(iy) - i \sin x \cdot \sin(iy)$$

$$\Rightarrow f'(z) = \cos(x+iy)$$

$$f'(z) = \cos z$$

=====

5. Verify $f(z) = \sin 2z$ is analytic or not, hence find its derivative.

Soln Given, $f(z) = \sin 2z \rightarrow (1)$

$$\text{let } z = x + iy$$

$$(1) \Rightarrow f(z) = \sin 2(x+iy)$$

$$= \sin(2x + 2iy)$$

$$f(z) = \sin(2x) \cdot \cos(2iy) + \cos(2x) \cdot \sin(2iy)$$

$$f(z) = \sin(2x) \cdot \cosh(2y) + \cos(2x) \cdot \sinh(2y)$$

$$\Rightarrow f(z) = u(x, y) + iv(x, y)$$

$$u = \sin(2x) \cdot \cosh(2y), v = \cos(2x) \cdot \sinh(2y)$$

$$\therefore \frac{\partial u}{\partial x} = 2\cos(2x) \cdot \cosh(2y), \frac{\partial u}{\partial y} = 2\sin(2x) \cdot \sinh(2y)$$

$$\frac{\partial v}{\partial x} = -2\sin(2x) \cdot \sinh(2y)$$

$$\frac{\partial v}{\partial y} = 2\cos(2x) \cdot \cosh(2y)$$

$$\therefore \frac{\partial u}{\partial x} = \frac{\partial v}{\partial y} \text{ and } \frac{\partial v}{\partial x} = -\frac{\partial u}{\partial y}$$

$\therefore f(z)$ is an analytic function.

$$\Rightarrow f'(z) = u_x + iv_x$$

$$f'(z) = 2\cos(2x) \cdot \cosh(2y) - i2\sin(2x) \cdot \sinh(2y)$$

$$\Rightarrow f'(z) = 2\cos(2x) \cdot \cos(2iy) - i2\sin(2x) \cdot \sin(2iy)$$

$$\Rightarrow f'(z) = 2[\cos(2x) \cdot \cos(2iy) - \sin(2x) \cdot \sin(2iy)]$$

$$\Rightarrow f'(z) = 2\cos(2x + 2iy)$$

$$f'(z) = 2\cos 2(x+iy)$$

$$\Rightarrow f'(z) = 2\cos 2z$$

=

6. Verify the analytic function $f(z) = \log z$, hence find its derivative.

Soln Given, $f(z) = \log z \rightarrow (1)$

$$\text{let } z = r_1 e^{i\theta}$$

$$(1) \Rightarrow f(z) = \log(r_1 e^{i\theta})$$

$$\Rightarrow f(z) = \log r_1 + \log e^{i\theta}$$

$$\Rightarrow f(z) = \log r_1 + i\theta \cdot \log e \quad \because \log e = 1$$

$$f(z) = \log r_1 + i\theta$$

$$\Rightarrow f(z) = u(r_1, \theta) + i v(r_1, \theta)$$

$$u = \log r_1, v = \theta$$

$$\therefore \frac{\partial u}{\partial r_1} = \frac{1}{r_1}, \quad \frac{\partial u}{\partial \theta} = 0$$

$$\frac{\partial v}{\partial r_1} = 0, \quad \frac{\partial v}{\partial \theta} = 1$$

$$\therefore \frac{\partial u}{\partial r_1} = \frac{1}{r_1} \frac{\partial v}{\partial \theta} \text{ and } \frac{\partial v}{\partial r_1} = -\frac{1}{r_1} \frac{\partial u}{\partial \theta}$$

$\therefore f(z)$ is analytic function.

$$\Rightarrow f'(z) = (u_{r_1} + i v_{r_1}) e^{-i\theta}$$

$$f'(z) = e^{-i\theta} \left(\frac{1}{r_1} + i(0) \right)$$

$$\Rightarrow f'(z) = e^{-i\theta} \left(\frac{1}{r_1} \right)$$

$$\Rightarrow f'(z) = \frac{1}{r_1 e^{i\theta}}$$

$$\therefore f'(z) = \frac{1}{z}$$

Harmonic property:

(1) If $f(z) = u(x, y) + i v(x, y)$ is an analytic, then its real and imaginary parts are both harmonics.

$$\text{i.e., } \frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = 0 \text{ and } \frac{\partial^2 v}{\partial x^2} + \frac{\partial^2 v}{\partial y^2} = 0$$

(2) If $f(z) = u(x, y) + iv(x, y)$ is an analytic, then its real and imaginary parts are both harmonics,

$$\text{i.e., } \frac{\partial^2 u}{\partial x^2} + \frac{1}{y} \frac{\partial u}{\partial y} + \frac{1}{y^2} \frac{\partial^2 u}{\partial y^2} = 0$$

$$\text{and } \frac{\partial^2 v}{\partial x^2} + \frac{1}{y} \frac{\partial v}{\partial y} + \frac{1}{y^2} \frac{\partial^2 v}{\partial y^2} = 0$$

Theorem :

If $f(z)$ is regular function of z , Show that

$$\left(\frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2} \right) (f'(|z|^2)) = 4(f'(|z|^2)).$$

Given, $f(z) = u(x, y) + iv(x, y) = u+iv$ is regular

$\Rightarrow f(z)$ is differentiable at any point of $z=x+iy$

$$\Rightarrow f'(z) = u_x + iv_x$$

$$\text{and WKT, } f'(|z|) = \sqrt{u^2 + v^2}$$

$$f'(|z|^2) = u^2 + v^2 = \phi \rightarrow (1)$$

$$\therefore f'(|z|) = \sqrt{u_x^2 + v_x^2}$$

$$f'(|z|^2) = u_x^2 + v_x^2 \rightarrow (2)$$

$$\text{LHS} = \left(\frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2} \right) \cdot f'(|z|^2)$$

$$= \left(\frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2} \right) \cdot \phi$$

$$\text{LHS} = \frac{\partial^2 \phi}{\partial x^2} + \frac{\partial^2 \phi}{\partial y^2}$$

$$\therefore \frac{\partial \phi}{\partial x} = 2u \cdot u_x + 2v \cdot v_x$$

$$\therefore \frac{\partial^2 \phi}{\partial x^2} = 2(u_{xx} \cdot u_x + u \cdot u_{xx}) + 2(v_{xx} \cdot v_x + v \cdot v_{xx})$$

$$\Rightarrow \frac{\partial^2 \phi}{\partial x^2} = \Re (U_x^2 + U \cdot U_{xx} + V_x^2 + V \cdot V_{xx}) \rightarrow (3)$$

$$\therefore \frac{\partial \phi}{\partial y} = \Re U \cdot V_y + \Re V \cdot V_y$$

$$\Rightarrow \frac{\partial^2 \phi}{\partial y^2} = \Re (U_y \cdot U_y + U \cdot U_{yy}) + \Re (V_y \cdot V_y + V \cdot V_{yy})$$

$$\Rightarrow \frac{\partial^2 \phi}{\partial y^2} = \Re (U_y^2 + U \cdot U_{yy} + V_y^2 + V \cdot V_{yy}) \rightarrow (4)$$

from (3) & (4) (or) LHS (consider)

$$\begin{aligned} \text{LHS} &= \Re (U_x^2 + U \cdot U_{xx} + V_x^2 + V \cdot V_{xx} + U_y^2 + U \cdot U_{yy} + V_y^2 + V \cdot V_{yy}) \\ &= \Re [U_x^2 + V_x^2 + U_y^2 + V_y^2 + U(U_{xx} + U_{yy}) + V(V_{xx} + V_{yy})] \\ &= \Re [U_x^2 + V_x^2 + U_y^2 + V_y^2 + U(0) + V(0)] \\ &= \Re [U_x^2 + V_x^2 + (-V_x)^2 + (U_x)^2] \\ &= \Re (U_x^2 + V_x^2 + V_x^2 + U_x^2) \\ &= \Re (U_x^2 + V_x^2) \\ &= \Re (f'(z)) \\ &\stackrel{=} {=} \\ &= \text{RHS} \end{aligned}$$

Theorem: If $\omega = f(z)$ is regular, then show that

$$\left\{ \frac{\partial}{\partial x} |f(z)|^2 + \left\{ \frac{\partial}{\partial y} |f(z)|^2 \right\}^2 \right\} = |f'(z)|^2.$$

Proof: Given $\omega = f(z) = u + iv$ is a regular \Leftrightarrow analytic.

$\therefore f(z)$ is differentiable at any point of $z = x+iy$.

$$\Rightarrow f'(z) = u_x + i v_x$$

$$\text{and w.r.t } |f(z)| = \sqrt{u^2 + v^2} = \phi$$

$$\Rightarrow u^2 + v^2 = \phi^2 \rightarrow (1)$$

$$\text{and } |f'(z)| = \sqrt{u_x^2 + v_x^2}$$

$$\Rightarrow |f'(z)|^2 = u_x^2 + v_x^2 \rightarrow (2)$$

diff. (1) wrt 'x' partially,

$$\therefore (1) \Rightarrow 2u \cdot u_x + 2v \cdot v_x = 2\phi \phi_x$$

$$\Rightarrow uu_x + v \cdot v_x = \phi \phi_x \rightarrow (3)$$

likewise diff. (1) wrt 'y' partially,

$$(1) \Rightarrow 2u v_y + 2v v_y = 2\phi \phi_y$$

$$\Rightarrow uu_y + v v_y = \phi \phi_y \rightarrow (4)$$

\therefore fun $f(z)$ is analytic.

$$\therefore \text{w.r.t } u_x = v_y, v_x = -u_y \\ u_y = -v_x$$

$$\therefore (4) \Rightarrow -u \cdot v_x + v \cdot u_x = \phi \phi_y$$

$$vu_x - u \cdot v_x = \phi \phi_y \rightarrow (5)$$

$$\therefore (3)^2 + (5)^2$$

$$(uu_x + v \cdot v_x)^2 + (vu_x - uv_x)^2 = \phi^2 \phi_x^2 + \phi^2 \phi_y^2$$

$$\Rightarrow u^2 u_x^2 + v^2 v_x^2 + 2uv \cdot v_x v_x + v^2 u_x^2 + u^2 v_x^2 - 2uv \cdot u_x v_x = \phi^2 \phi_x^2 + \phi^2 \phi_y^2$$

$$\Rightarrow u^2 (u_x^2 + v_x^2) + v^2 (u_x^2 + v_x^2) = \phi^2 (\phi_x^2 + \phi_y^2)$$

$$\Rightarrow (u^2 + v^2) (u_x^2 + v_x^2) = \phi^2 (\phi_x^2 + \phi_y^2)$$

$$\Rightarrow \phi^2 (u_x^2 + v_x^2) = \phi^2 (\phi_x^2 + \phi_y^2)$$

$$\Rightarrow \phi_x^2 + \phi_y^2 = u_x^2 + v_x^2$$

$$\Rightarrow \left(\frac{\partial \phi}{\partial x} \right)^2 + \left(\frac{\partial \phi}{\partial y} \right)^2 = |f'(z)|^2$$

$$\Rightarrow \left\{ \frac{\partial}{\partial x} |f(z)| \right\}^2 + \left\{ \frac{\partial}{\partial y} |f(z)| \right\}^2 = |f'(z)|^2$$

Theorem: If $f(z)$ is regular function with Constant Modulus,
Show that $f(z)$ is also a constant function.

Given, $w=f(z)=u+iv$ is regular function.

$\therefore f(z)$ is differentiable.

$$\therefore f(z) = u_x + iv_x$$

$$\text{and } |f'(z)| = \sqrt{u_x^2 + v_x^2}$$

$$\Rightarrow |f'(z)|^2 = u_x^2 + v_x^2 \rightarrow (1)$$

$$\text{and given } |f(z)| = k$$

$$\Rightarrow \sqrt{u^2 + v^2} = k$$

$$\Rightarrow u^2 + v^2 = k^2 \rightarrow (2)$$

diff. eqn (2) partially w.r.t 'x'.

$$(2) \Rightarrow 2uu_x + 2vv_x = 0$$

$$\Rightarrow uu_{xx} + vv_{xx} = 0 \rightarrow (3)$$

111⁴ (2) \Rightarrow w.r.t 'y' partially

$$(2) \Rightarrow 2uv_y + 2vv_y = 0$$

$$\Rightarrow uv_y + vv_y = 0 \rightarrow (4)$$

\therefore But $f(z)$ is analytic

$$\therefore u_x = v_y \text{ and } v_x = -u_y$$

$$\Rightarrow v_y = -v_x$$

$$\therefore (4) \Rightarrow u(-v_x) + v u_x = 0$$

$$\Rightarrow vu_x - uv_x = 0 \rightarrow (5)$$

$$(3)^2 + (5)^2 (U_{xx} + V_{xx})^2 + (V_{xx} - UV_{xx})^2 = 0$$

$$\Rightarrow U^2 U_{xx}^2 + V^2 V_{xx}^2 + 2UV \sqrt{V_x U_x + V^2 U_x^2 + U^2 V_x^2} - 2UV U_x V_x = 0$$

$$\Rightarrow U^2 (U_{xx}^2 + V_{xx}^2) + V^2 (U_x^2 + V_x^2) = 0$$

$$\Rightarrow (U^2 + V^2)(U_x^2 + V_x^2) = 0$$

$$\Rightarrow K^2 (U_x^2 + V_x^2) = 0$$

$$\Rightarrow K^2 \neq 0, U_x^2 + V_x^2 = 0$$

$$\Rightarrow |f'(z)|^2 = 0$$

$$\Rightarrow |f'(z)| = 0$$

$$\therefore f(z) = C$$

$\Rightarrow f(z)$ is Constant.

Problems:

1. Show that $f(z) = \cosh z$ is analytic and hence find its derivative.

Sohr $f(z) = \cosh z$

$$\text{let } z = x+iy$$

$$\Rightarrow f(z) = \cosh(x+iy) \rightarrow (1)$$

$$\text{WKT, } \cosh \theta = \cos i\theta$$

$$\begin{aligned} (1) \Rightarrow f(z) &= \cosh i(x+iy) \\ &= \cosh(ix+i^2y) \\ &= \cosh(ix-y) \\ &= \cos(ix) \cdot \cos y + \sin(ix) \cdot \sin y \\ &= \cosh x \cdot \cos y + i \sinh x \cdot \sin y. \end{aligned}$$

$$\Rightarrow f(z) = u(x,y) + iv(x,y)$$

$$\therefore u = \cosh x \cdot \cos y, v = \sinh x \cdot \sin y$$

$$U_x = \sinh x \cdot \cos y, V_y = -\cosh x \cdot \sin y$$

$$U_y = \cosh x \cdot \sin y, V_y = \sinh x \cdot \cos y.$$

$$\therefore U_x = V_y, V_x = -V_y$$

$\therefore f(z)$ is analytic

$$\therefore f'(z) = U_x + iV_x$$

$$\Rightarrow f'(z) = \sinhx \cdot \cosy + i \coshx \cdot \siny$$

when $x=z, y=0$

$$\Rightarrow f'(z) = \underline{\underline{\sinhz}}$$

Q. Show that $f(z) = z + e^z$ is analytic, hence find its derivative.

Soh

$$f(z) = z + e^z$$

$$\text{let } z = x + iy$$

$$\Rightarrow f(z) = (x+iy) + e^{(x+iy)}$$

$$= (x+iy) + e^x \cdot e^{iy}$$

$$= (x+iy) + e^x \cdot (\cosy + i\siny)$$

$$= x + e^x \cdot \cosy + iy + i e^x \siny$$

$$= (x + e^x \cdot \cosy) + i(y + e^x \siny)$$

$$\Rightarrow f(z) = u(x, y) + i v(x, y)$$

$$\Rightarrow u = x + e^x \cdot \cosy, v = y + e^x \cdot \siny$$

$$\therefore U_x = 1 + e^x \cdot \cosy, V_y = -e^x \cdot \siny$$

$$V_x = e^x \cdot \siny, V_y = 1 + e^x \cdot \cosy$$

$$\therefore U_x = V_y \text{ and } V_x = -U_y.$$

$\therefore f(z)$ is analytic.

$$\therefore f'(z) = U_x + iV_x$$

$$\Rightarrow f'(z) = 1 + e^x \cosy + i e^x \siny$$

$$= 1 + e^x (\cosy + i \siny)$$

$$\text{put } x=z, y=0 \Rightarrow f'(z) = \underline{\underline{1+e^z}}$$

3. Find the analytic function, whose real part is $u = \frac{x^4 \cdot y^4 - 2x}{x^2 + y^2}$

Given, $u = \frac{x^4 \cdot y^4 - 2x}{x^2 + y^2} \rightarrow (1)$

diff. (1) partially w.r.t 'x'.

$$\therefore (1) \Rightarrow \frac{\partial u}{\partial x} = \frac{(x^2 + y^2)(4x^3 y^4 - 2) - (x^4 \cdot y^4 - 2x)(4y^2)}{(x^2 + y^2)^2}$$

$$\therefore \frac{\partial u}{\partial x} = \frac{(\bar{z}^2 + 0)(4\bar{z}^3(0) - 2) - \bar{z}^4(0) - 2(\bar{z})(2\bar{z})}{(\bar{z}^2)^2} \quad \text{when } x = \bar{z}, y = 0$$

$$\Rightarrow \frac{\partial u}{\partial x} = \frac{\bar{z}^2(-2) + 4\bar{z}^3}{\bar{z}^4} = \frac{-2\bar{z}^3 + 4\bar{z}^3}{\bar{z}^4}$$

$$\Rightarrow \frac{\partial u}{\partial x} = \frac{2\bar{z}^3}{\bar{z}^4}$$

$$\therefore \frac{\partial u}{\partial x} = \frac{2}{\bar{z}^2}$$

$$\text{likewise } \frac{\partial u}{\partial y} = \frac{(x^2 + y^2)(4x^4 y^3) - (x^4 \cdot y^4 - 2x)(4y)}{(x^2 + y^2)^2} = -\frac{\partial v}{\partial x}$$

$$\therefore \frac{\partial v}{\partial x} = \frac{2y(x^4 \cdot y^4 - 2x) - (x^2 + y^2)(4x^4 y^3)}{(x^2 + y^2)^2} \quad \text{when } x = \bar{z}, y = 0$$

$$= \frac{2(0) \cdot (\bar{z}^4(0) - 2(\bar{z})) - \bar{z}^2(4\bar{z}^4(0))}{\bar{z}^4}$$

$$\therefore \frac{\partial v}{\partial x} = 0$$

$$= \frac{1}{2} \left(\frac{\cos z - 1}{(\cos z - 1)^2} \right)$$

$$\Rightarrow -v_x - u_x = \frac{1}{2} \frac{1}{\cos z - 1} = -\frac{1}{2} \frac{1}{(1 - \cos z)} \rightarrow (4)$$

$$(3) + (4) \Rightarrow -2v_x = 0$$

$$\Rightarrow v_x = 0$$

$$(3) - (4) \Rightarrow 2u_x = \frac{1}{1 - \cos z}$$

$$u_x = \frac{1}{2(1 - \cos z)}$$

$$\Rightarrow f'(z) = \frac{1}{2} \left(\frac{1}{1-\cos z} \right)$$

$$= \frac{1}{2} \left(\frac{1}{2 \sin^2(z/2)} \right)$$

$$\Rightarrow \frac{df}{dz} = -\frac{1}{2} \left(\frac{1}{2} \frac{1}{\sin^2(z/2)} \right), \int df = \int \frac{1}{2} \left(\frac{1}{2} \frac{1}{\sin^2(z/2)} \right) dz$$

$$\Rightarrow f(z) = \frac{1}{2} \int (-\operatorname{cosec}^2(z/2)) dz$$

$$\Rightarrow f(z) = +\frac{1}{2} \cot(z/2) + C \rightarrow (5)$$

$$\text{By condition, } f(\pi/2) = +\frac{1}{2} \cot(\pi/2) + C$$

$$0 = +\frac{1}{2} (1) + C$$

$$\boxed{C = -1/2} \quad \therefore (5) = f(z) = +\frac{1}{2} \underline{\cot(z/2)} - \frac{1}{2}$$

13. Find the analytic function of $f(z) = u+iv$, if

$$u-v = (x-y)(x^2+4xy+y^2).$$

Given, $f(z) = u+iv$ and

$$\text{Given, } u-v = (x-y)(x^2+4xy+y^2)$$

$$\Rightarrow u-v = x^3+4x^2y+3y^2-x^2y-4xy^2-y^3$$

$$\Rightarrow u-v = x^3+3x^2y-3xy^2-y^3 \rightarrow (1)$$

diff (1) wrt 'x' partially

$$\therefore (1) \Rightarrow u_x - v_x = 3x^2 + 6xy - 3y^2 \rightarrow (2)$$

when $x=z, y=0$

$$\therefore (2) \Rightarrow u_x - v_x = 3z^2 \rightarrow (3)$$

IIIrd

$$v_y - v_y = 3x^2 - 6xy - 3y^2 \rightarrow (4)$$

when $x=z, y=0$

$$\therefore (3) \quad U_y - V_y = 3\bar{z}^2 \rightarrow (5)$$

$$\text{WKT } U_y = -V_x, \quad V_y = U_x$$

$$\therefore (4) \Rightarrow -V_x - U_x = 3\bar{z}^2 \rightarrow (6)$$

$$\therefore (3) + (6) \Rightarrow -2V_x = 6\bar{z}^2$$

$$\Rightarrow -V_x = 3\bar{z}^2$$

$$\Rightarrow V_x = -3\bar{z}^2$$

$$(3) - (6) \Rightarrow 2U_x = 0$$

$$\Rightarrow U_x = 0$$

\therefore WKT,

$$f'(z) = U_x + iV_x$$

$$\Rightarrow f'(z) = 0 + i(-3\bar{z}^2)$$

$$\Rightarrow f'(z) = -3i\bar{z}^2$$

$$\Rightarrow \frac{df}{dz} = -3i\bar{z}^2$$

$$\Rightarrow \int df = \int -3i\bar{z}^2 \cdot d\bar{z}$$

$$\Rightarrow \int df = -3i \int \bar{z}^2 \cdot d\bar{z}$$

$$\Rightarrow f(z) = -3i \frac{\bar{z}^3}{3} + C$$

$$\Rightarrow f(z) = -i\bar{z}^3 + C$$
